

**Kit contents:**

2 X Neon's

1 X Inverter

1 X Switch and wiring

**Step 1**

Slot neon clips in to inverter (2x connections)

**Step 2**

Connect wiring to inverter via clip connected to red and black wire.

When all connected circuit should look like the above.

**Step 3**

Now that the circuit is constructed a power supply has to be found to power the neon's. Firstly cut the red wire where you wish to connect to power source. Any 12V source will power the neon's. Two options are available.

These neon's connect directly to the battery of the scooter. This can be done easily by connecting one end of the red wire to the live terminal of the battery and the other to the negative. For the purpose of using these neon's on a scooter there should be enough wiring to reach the battery if this is not the case wires may need extending in places.
